Earthheritance — User Guide

A plain-language guide for everyone working in the cocopeat manufacturing & export workspace.

1. Getting started

Signing in

1. Open your workspace address (your administrator will share it).
2. Enter the **email address** and the **password** your administrator gave you — as two separate values in the two separate fields.
3. If you were invited by email instead, first open that invitation and choose a passphrase of at least **12 characters**. You are then brought to your Overview.

Access is by invitation only. If you cannot sign in, or you think your password needs resetting, contact your administrator — they can confirm your email or reset your password from the Team page.

Your Overview

The first page after sign-in shows the numbers that matter to **your** role — stock levels, open orders, production, payments due, and the latest activity. What you see depends on your access level; colleagues with other roles see different cards.

On your phone

The workspace is fully responsive: the menu collapses into a hamburger button, tables scroll, and every form is touch-friendly. You can approve, record, dispatch and print from a phone.

Navigation

The sidebar groups everything:

Group	Items
(top)	Overview , global Search (jump to any code/name)
Partners	Suppliers , Buyers
Operations	Inventory , Production , Exports & shipments
Finance	Supplier payments , Buyer receipts
Insights	Reports

Group	Items
Administration (admins only)	Team members, Roles & permissions, Company settings
(bottom)	Setup & guidance, your account menu (Change password, Sign out)

A small live-refresh indicator pulls in changes made by colleagues, so you rarely need to reload manually.

2. How your role shapes the app

Role	Typical job	What you can do
Administrator	Owner / IT	Everything, including team, roles and settings
Manager	Operations manager	View every module, approve stock adjustments, read the audit trail
Stores	Warehouse officer	Suppliers, purchase orders, goods receipts, items, stock, adjustments
Production	Factory supervisor	Record production batches and wastage, view stock
Export Sales	Sales / export desk	Buyers, export orders, shipments, invoices
Finance	Accounts	Supplier bills & payments, buyer invoices & receipts, reports

You only see modules your role can open. If a button is missing, you most likely lack the permission — ask an administrator.

Golden rule of data: nothing is ever deleted. Mistakes are corrected by cancelling, reversing or deactivating, so your history always adds up.

3. Suppliers & purchasing (Stores)

Add a supplier

Suppliers → **New supplier**. Name, contact person, phone, email, address, country, tax ID, payment terms and a **preferred currency** (choose **LKR** for local suppliers — every purchase form for them will start in LKR). You can also store bank details for payments.

Create a purchase order

1. **Inventory** → **Purchases** → **New purchase order**.
2. Pick the supplier — the currency dropdown defaults to their preferred currency (change it from the dropdown if needed).
3. Add lines: item, quantity, unit price. Set expected delivery date.
4. The order starts as a **Draft**. Open it and press **Confirm** when the order is really placed.

Receive goods

Open a confirmed purchase → **Receive goods**. Enter the quantity arriving per line (partial receipts are fine — the status moves to *Partially received*). Each receipt creates or extends a **lot** (batch number) so stock stays traceable to its supplier.

Items, opening stock and adjustments

- **Inventory** → **Items** → **New item**: raw materials (wet cocopeat, blocks...) and finished products (5 kg bags, discs...), each with one stock unit, net weight and packaging spec.
- **Opening stock** records what was already in the warehouse before go-live.
- **Stock adjustments** fix counting errors: anyone with store access *requests* an increase/decrease with a reason; a manager (or admin) *approves or rejects* it — two pairs of eyes on every stock change.

Attach paperwork

Any purchase or goods-receipt row has a **Files** link. Upload delivery notes, weighing slips, certificates (PDF/JPG/PNG/DOCX/XLSX up to 10 MB). Files are private: only roles connected to that record's module can see or download them.

4. Production (Production role)

1. **Production** → **New batch**.
2. Add the **inputs**: lots of raw material consumed (pick from stock; available quantities are shown).
3. Add the **output**: item, quantity produced, and any **wastage**.
4. Save as **Draft** while confirming figures, then **Post** the batch. Posting moves stock in one atomic step: raw lots go down, a new finished lot is created, wastage is recorded.
5. A posted batch can be **Reversed** only if the produced lot has not been used or shipped yet. Reversal restores all stock exactly.

Every finished lot carries a traceability line back to the batch and the original suppliers — visible on the batch page and supplier profiles.

5. Buyers & exports (Export Sales)

Add a buyer

Buyers → **New buyer**: contact, billing and shipping addresses, destination country, payment terms, and **preferred currency** (usually **USD** or another foreign currency for overseas buyers).

Create an export order

1. **Exports & shipments** → **New export order**.
2. Choose the buyer — currency defaults to their preference (dropdown: USD, LKR, EUR, GBP, AED, ...).
3. Add product lines (quantity, unit price), incoterms and destination.

4. **Confirm** the order when agreed. Confirming **reserves** matching finished stock automatically (oldest lots first). Available quantities on the Inventory page update instantly.

Plan and dispatch a shipment

Open the order → **New shipment**:

1. Fill container number, port of loading/discharge, ETD, and the lines (lots + quantities) going into this container. Status: **Draft**.
2. Mark **Ready** when goods are staged.
3. **Dispatch** when the container leaves — reservations are consumed and stock physically moves out. A partially filled order stays *Partially shipped*; add more shipments until complete.
4. Mark **Delivered** on arrival. **Close** the order when everything is settled — any leftover reservations are released.

Invoice a shipment

On a dispatched shipment, press **New invoice**: issue/due dates, currency (order's currency preselected), exchange rate, and the invoice lines. Printable **Commercial invoice** and **Packing list** (with your company letterhead) open from the invoice/shipment rows — use your browser's Print dialog for PDF.

Attach supporting documents (BL, certificates, packing photos) via the **Files** links on orders, shipments and invoices.

6. Money (Finance)

Currency rule: **supplier side is usually LKR, buyer/export side is USD or another foreign currency.**

Amounts are never mixed across currencies — every register, balance and report is grouped per currency. Record the exchange rate you used on each document for reporting.

Paying suppliers

1. **Supplier payments** → **New bill**: supplier, issue/due date, currency (dropdown), amount, optionally linked to a purchase order.
2. **Record payment** when money goes out (bank transfer, cash, cheque + reference).
3. **Allocate** the payment to one or more bills. An advance stays as an *unapplied balance* until you allocate it.
4. Wrong entry? **Reverse** the payment — allocations unwind, balances return. The record stays visible for the audit trail.

Receiving from buyers

1. Invoices come from the export desk (see §5). They appear in **Buyer receipts** with their outstanding balance.
2. **Record receipt** for each incoming payment, then **allocate** it to the invoice(s) it settles (partial and advance payments supported).

3. Receipts can be reversed the same way.

Staying on top of things

- The registers filter by party, date range, currency, reference and allocation state (open / partial / settled).
- **Reports** → **Overdue documents** lists past-due invoices and bills.
- Payment evidence (bank slips) belongs on each bill/payment/receipt **Files** tab.

7. Reports (Manager, Finance, Admin)

Reports opens a set of summaries: stock levels, production output vs consumption vs wastage, export sales by buyer/product/country, shipment schedule, overdue documents, and unapplied balances. Each report:

1. Filter by date (and other fields where offered).
2. Read on screen, or press **Export CSV** for Excel.

Reports only ever contain rows your role is allowed to see.

8. Managing the team (Administrator)

Invite someone

1. **Team members** → fill name, email, pick an access level → **Send invitation**. They receive an email to set their own password (link valid 24 hours).
2. If the invitation expires, just send it again.

Add someone without an email

No mail server set up, or a colleague has no working email? Use **Add without email** on the same Team page:

1. Fill their name, email address and access level.
2. Type a sign-in password (at least **12 characters**) twice and press **Add member**.
3. Nothing is emailed. Give them the workspace address and that password directly — they can sign in immediately and change it themselves later under **Account security**.

Because you set the password on their behalf, share it privately and ask them to change it at their first sign-in.

When a colleague cannot sign in

If their row shows **Waiting for verification**, their invitation email was never opened — and the system will not let anyone sign in to an unverified address, whatever password they type. Two ways to fix it from their row:

1. **Confirm email** — marks the address verified. They still need a password, so use this together with their invitation link or the next option.
2. **Reset password** — sets a new password *and* confirms the address in one step. This is usually all that is needed.

Tell them the message on the sign-in screen now says which of the two problems they have, instead of only blaming the password.

Change access or pause someone

On each team row: pick a new role and/or set **Inactive**, then **Save**. Deactivating removes access immediately but keeps all of that person's history. The system always protects at least one active administrator.

Reset someone's password

Locked-out colleague: on their row press **Reset password**, type a new passphrase twice, **Save password**. They are signed out on every device and must use the new password next time. Tell them to change it themselves afterwards via the account menu → **Change password**. (You cannot reset the last active administrator's password from here — that person uses their own Change password page.)

Fine-tune roles

Roles & permissions lets you tick individual permissions per role (everything except the administrator role, which is always full). Changes apply to all staff holding that role on their next action.

9. Company settings (Administrator)

Settings holds the details used across the app — company name, email, phone, address and country appear as the **letterhead** on printable invoices and packing lists. Set the **base currency** (your reporting currency — for a Sri Lankan exporter this is typically LKR) and the warehouse name.

10. Account security (everyone)

Account menu (top right) → **Change password**. Pick at least 12 characters; changing it signs you out of your other devices automatically.

11. Good practice

- Enter real documents and amounts — the app ships with **no demo data**, so every figure you see came from your team.
- Use **Draft** states to park work-in-progress; confirm only when real.
- Attach the paperwork (Files) at the moment the transaction happens, not weeks later.
- One person records, another approves/reverses where the app asks for it.

- Check the Overview every morning — overdue items are surfaced for you.

12. Troubleshooting & common messages

You see	What it means	What to do
"You do not have permission to perform this action"	Your role doesn't include this operation	Ask an administrator for access or to perform it
"Your staff access is not active"	You were deactivated or your profile is incomplete	Contact your administrator
"The change could not be saved. Check your database setup and try again."	A technical problem on the server side	Retry once; if it persists, report the exact screen and values to your administrator
"Insufficient stock..." / "not enough available"	The lot doesn't hold the quantity (some may be reserved)	Check Inventory → available vs reserved; adjust or reserve elsewhere
"Keep at least one active administrator"	You can't remove the last admin's access	Promote another administrator first
"Only a draft order can be confirmed"	The document already moved to the next stage	Check its status; use the correct action for that status
A Files upload fails	File over 10 MB or unsupported type	Compress or convert (PDF/JPG/PNG/WEBP/DOCX/XLSX)
Numbers look stale	Someone else is editing	Wait a moment — the live indicator refreshes automatically

Need the technical details (architecture, security, deployment)? See the [System Document](#).
